Installation

- Have Apple ID handy
- Decide on an upgrade strategy
 - In-place upgrade – the default method – recommended
 - Clean Install – more complicated
 - Install over Leopard – better to upgrade to Snow Leopard first
- Bring your bootable backup up-to-date
- Obtain the Yosemite installer (5GB)
- Make a copy - When the download completes and the Yosemite installer opens, right-click its icon in the Dock and choose the option to reveal it in the Finder. From here, copy it to a USB drive, and then use this drive to copy it to your additional Macs where you can run it. Be sure to do this before you install Yosemite, as the installer will be deleted as part of the upgrade process.

Option - Install on Clone

If you decide to upgrade but are still a little uncertain about how your system’s configuration will work with Yosemite, then by cloning your Mac when you back it up, you can boot to the clone, upgrade it, and then test your various software packages and services (at this point, the list of used features you made earlier will come in handy).
